1. INTRODUCTION

1.1 BACKGROUND

Bitzios Consulting has been commissioned by Roads and Maritime Services (RMS), NSW to undertake a traffic generation study of drive through coffee outlets (outlets). The need for this study has arisen from the increasing number of outlets opening in recent times and the RMS Guide to Traffic Generating Developments (Guide) does not include this specific type of development.

Whilst the Guide contains data on drive-through fast food outlets, the drive-through coffee outlets are unique in that the business focus is almost exclusively on beverage sales with limited food available. Most of these outlets do not have seating and only have limited parking mainly for the purpose of providing a space for patrons to park while they wait for a larger than usual order. This service is becoming increasingly popular and in order to assist in better and consistent planning outcomes it is necessary for reliable trip generation and parking demand data to be collected and analysed to include in the Guide.

1.2 SCOPE

The scope of this study can be summarised as follows:

- Determine a suitable sample of outlets required to provide meaningful results;
- identification of suitable outlet survey sites;
- obtain agreements from outlets to conduct surveys at their premises;
- gather site survey data relevant to the study objectives;
- conduct on-site surveys to collect all road transport sub-mode trip generation data, time-segmented usage patterns and service times;
- tabulate, analyse and graphically present collected data to identify key statistical dependency relationships; and
- reporting of survey and analysis methods, identification of relevant predictive statistical relationships between outlet operations and attributes, comparisons, trends, consistencies, variations. All relevant data will be presented in a RMS standardised summary table and entered in NZ Trips Database Bureau (TDB) Site Survey Summary Sheet.

This report presents the data collected from the survey sites together with key derived statistics and observations and will be followed by a separate Analysis Report.

2. SITE SELECTION

Initial investigation of suitable sites revealed that there were variations in the location, type and operation of outlets. It was therefore necessary to seek a range of outlets that would provide a representation of these variations. Outlets were sought in metropolitan, sub-metropolitan and regional areas of New South Wales, Queensland and Victoria.

Twenty-two outlets were identified as possible suitable sites and were invited to participate in the study. Of these, ten outlets provided agreement for surveys to be conducted at their premises. These sites were considered a suitable sample size, providing a range of location, operation type, frontage road traffic volumes, opening hours, size, exposure to passing traffic and visibility. Whilst the selection process to secure participation of suitable sites targeted businesses that had been operating for at least one year, due to the limited number of outlets prepared to participate in the study, two of the ten sites, both in Bathurst, Regional NSW, do not meet this criterion, having opened in September 2014.

3. SURVEY PROCEDURE

3.1 SURVEY SCHEDULE

Outlet sites were surveyed between 12th May 2015 and 23rd June 2015. Two of the ten outlets were surveyed for one week and the other outlets were surveyed on a weekday during the peak business periods in the morning and afternoon. Other than the two week-long surveys all surveys were conducted on either Tuesday or Wednesday and all surveys were conducted outside of school holidays or public holiday weeks. Opening times of businesses vary and is indicative of the peak periods of patronage experienced by the outlet.

All morning surveys were conducted over a 2½ hour period between 6:30am and 9:00am to ensure comparison consistency and to capture the peak business hour of operation. The business nature of drive-through coffee outlets attracts mostly morning patronage, which is reflected by the number of outlets that elect not to open in the afternoon or close earlier than the road network PM peak adjacent to the business, and therefore afternoon survey times vary.

All afternoon surveys were conducted over a 2 hour period and where outlets were open later in the afternoon 3:00pm to 5:00pm was chosen to correlate with expected road network PM peak times. The week-long survey for Zipper Drive-Through Coffee outlet in Concord NSW was conducted over a continuous 12 hour period between 6:00am and 6:00pm on six days. The other week-long survey conducted at Espresso Lane in Biggera Waters Queensland between 6:00am and 10:00am was done for six days. Both outlets were closed on Sunday. The times for the week-long surveys are considered to be suitable to achieve the project objective of assessing the degree of daily variation, particularly in conjunction with analysis of the other morning and afternoon peak surveys. The survey dates and times are included in Appendix A - Survey Data Summary.

3.2 DATA COLLECTION SURVEYS

A range of data was collected during the on-site surveys to achieve the study objectives. To facilitate analysis and presentation of data in the appropriate time segmentation a number of pro forma survey data collection sheets were used for the on-site surveys. These have formed the basis for the survey raw data which appear in Appendices B to K. The following data was collected during the on-site surveys:

- Number of site entry and exit points;
- frontage roads AM and PM peaks;
- drive-through lane capacity (length available for queuing);
- on-site parking availability (including bikes);
- number of waiting bays;
- seating provision - internal and external;
- number of ordering booths or terminals;
- number of collection points;
- tandem booths i.e. two booths - one for coffee collection & one for payment;
- record of the time that a vehicle enters the site;
- record of the time that the same vehicle exits the site;
- number of entering and exiting vehicles (cars/HVs) (15 minute blocks);
- number of vehicle occupants (15 minute blocks);
- number of pedestrians and cyclists (15 min blocks);
- number of queued vehicles (every 5 minutes); and
- number of on-site parked vehicles relevant to the site (every 15 minutes)

In addition to the above data, selected patrons were asked three brief questions aimed at determining trip origin, percentage of passing trade and establishing a relationship between order size and service time. The question asked were:

1. "Have you made the trip here just for the coffee or have you dropped in on your way somewhere else?"
2. "Are you just ordering coffee today, or something extra?"
3. "Can I have your postcode please?"

Surveyors found that the practicality of collecting questionnaire survey information was dependent on site characteristics and the layout of each outlet. Additionally, outlet operators were generally concerned with customers not being delayed and therefore surveyors were sometimes limited in the locations that they could conduct counts and ask questions. One outlet (Johnny Bean Good Coffee, Bathurst, NSW) did not wish to have customers surveyed, however the quantum of data gathered from other outlets was sufficient to establish conclusions.

3.3 SITE INFORMATION

The following additional site data and operational information was gathered prior to the on-site survey to record details relating to the outlet's physical structure, layout, operational characteristics and facilities, with the objective of establishing relationships between various site operational characteristics:

- Building area;
- number of employees on a typical shift;
- range of products available;
- operating times;
- year opened;
- surrounding land use; and
- relevant local issues.

4. SURVEY RESULTS

The survey data collected on-site is contained in Appendices B to K and includes all data relating to vehicle and pedestrian counts, parking, frontage road network volumes and customer interviews.

Appendix A, Survey Data Summary contains a summary of all data and key derived statistical relationships.

The survey data collected for the two weekly sites have been collated and presented in Appendix M. Comparison of the daily totals for both sites show that there is no clear indicator of which weekday is the busiest though graphs indicate that mid to late week days are busier. It is however clearly evident that Saturday is less busy than the week days and both outlets have elected to close on Sunday.

4.1 PRELIMINARY DATA VERIFICATION

Survey data and key derived statistics have been cross-checked against data contained in the Guide, *Land Use Traffic Generation – Data and Analysis 22: Drive-Through Restaurants (1993)*, *Land Use Traffic Generation – Data and Analysis 5: Fast Food (1980)*, and *ITE Trip Generation Rates – 8th Edition*. The purpose of this comparison is to check for expected consistencies and variations and to identify any erroneous data. All survey data reviewed were within expected ranges and considered to be reasonable and error free.

Appendix L, Initial Data Verification provides a comparison summary table of key data and derived statistics.

5. DATA ANALYSIS AND COMPARISONS

5.1 SUMMARY AND KEY STATISTICS

The survey data shows that there are key operational characteristics associated with drive-through coffee outlets as follows:

- There are significantly more trips generated in the AM peak than PM peak;
- Based on the week-long surveys, there were a very low number of customers on Saturday and the outlets were closed on Sunday, which would explain why most drive through coffee outlets do not elect to open on weekends;
- Based on the outcomes of the customer interviews there is a high proportion of passing trade throughout the day, also verified by postcode data;
- There does not appear to be a statistically significant correlation between road frontage traffic volumes and the number of drive through coffee customers;
- There does not appear to be a correlation of gross floor area to trip generation; and
- There appears to be some correlation between trip generation and queue lengths.

Figures produced in the Survey Data Summary, Appendix A, together with graphs and tables shown below demonstrate the conclusions of the above preliminary findings.

5.2 ANALYSIS OF INDEPENDENT AND DEPENDENT VARIABLE RELATIONSHIPS

Relationships between various independent and dependent variable data were tested to determine statistically relevant linkages between various parameters and the trip generation of drive through coffee outlets.

Based on initial analysis of the survey data and recognition that there was not a significant association between variables it was decided that multiple linear regression analysis would not be useful and therefore in order to determine the degree of relationships between dependent and interdependent variables a simple linear regression equation has been applied as follows:

$$Y = a + bx$$

Where Y is the dependant variable – the particular parameter it is wished to predict, and 'x' is the independent variable used for the prediction. The degree of accuracy is represented by the coefficient of determination, R², where:

$$R^2 = A/B$$

Where:

A = variation in Y explained by the combined linear influence of the independent variables;

B = total variation in Y.

R² represents the percentage of variation in the dependant variable and therefore how much of the variation is based on the independent variables. For example a R² result of 1.0 indicates that 100% of variation in the dependent variable is associated with the independent variable, therefore as the R² value approaches 100% the more accurate the results become. Values less than 80% are not considered accurate enough to indicate a significant relationship between the dependent and independent variable. A range of independent variables were tested against selected dependent variables and are listed in Table 5.1 overleaf.

Table 5.1: Independent and Dependant Variable Relationships Analysed

AM Period Roadside Traffic Volumes	Trip Generation	Table 5.15

5.3 DATA ANALYSIS

Initial data analysis indicated that the AM period produced significantly more trips than the PM, and as such it was not considered necessary to undertake a detailed analysis of the PM period. In the following analysis', figures in the tables have been extracted from the datasets contained in the Appendices.

5.3.1 AM Network Frontage Road Traffic in CBD Direction and Trip Generation

Table 5.2 and Figure 5.1 show the data and analysis to test for any influence of the AM peak network frontage road traffic volumes on trip generation. "Frontage Road AM Network Hour in CBD Direction" refers to all traffic travelling towards the CBD on the road fronting each Drive-Thru Coffee Outlet (DCO) during the AM network peak hour. "AM Trip Generation" refers to vehicle trips (twice vehicles served) utilising each DCO during the AM network peak hour.

Table 5.2: Trip Generation Relative to AM Network Traffic Volumes in CBD Direction

DCO	Frontage Road AM Network Peak in CBD direction (veh)	AM Trip Generation (veh)	% AM Trip Generation of Frontage Road Traffic
1	240	112	46.67%
2	99	88	88.89%
3	4556	126	2.77%
4	2758	116	4.21%
5	689	32	4.64%
6	1384	108	7.80%
7	1536	112	7.29%
8	1432	56	3.91%
9	180	70	38.89%
10	1900	234	12.32%
<i>Average</i>	<i>1477</i>	<i>105</i>	<i>21.74%</i>

The relationship between each Drive-Thru Coffee Outlet (DCO) trip generation and the CBD bound traffic volumes on the frontage road is displayed in Figure 5.1 below.

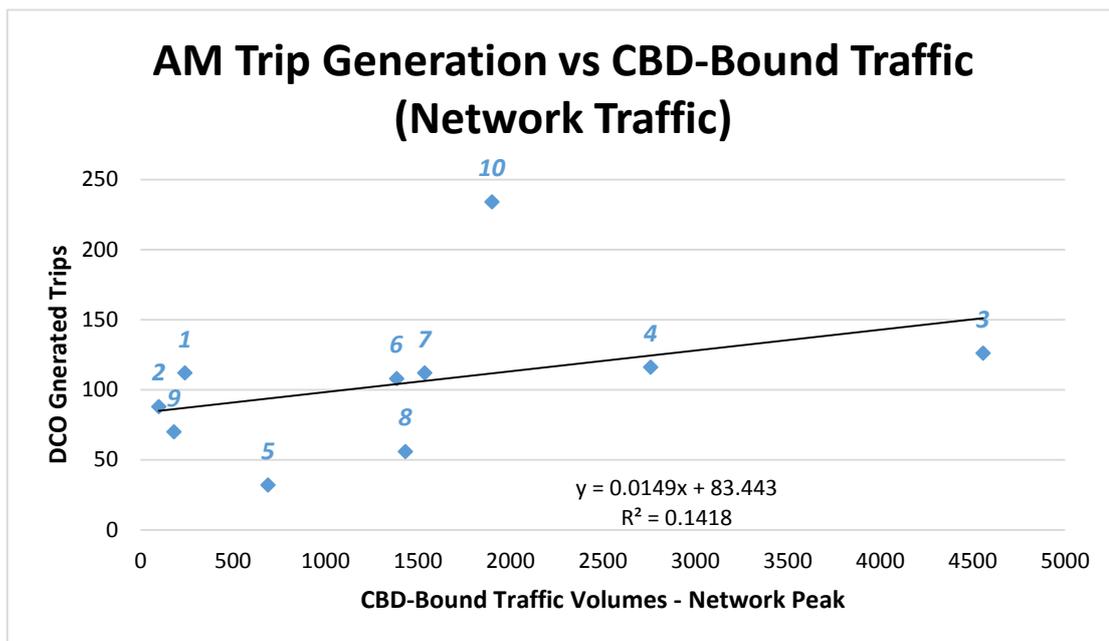

Figure 5.1: Correlation between AM trip generation and Frontage Road Traffic Volumes (Network - Peak)

While an increase in total frontage traffic does show a minor trend of increasing DCO trips the trend is not consistent across all outlets. DCO 5, 8 and 10 show that generated trips are not reliant on the total frontage traffic. The calculated R² result indicates a 14% association with the independent variable, and as such it is considered that the analysis does not show an accurate and consistent relationship. As such no clear correlation or relationship can be formed.

5.3.2 AM Site Peak Frontage Road Traffic in CBD Direction and Trip Generation

Table 5.3 and Figure 5.2 show the data and analysis to test for any influence of the AM peak hour frontage road traffic volumes on trip generation. "Frontage Road AM Site Peak Hour in CBD Direction" refers to all traffic travelling towards the CBD on the road fronting each Drive-Thru Coffee Outlet (DCO) during the AM site peak hour. "AM Trip Generation" refers to vehicle trips (twice served) utilising each DCO.

Table 5.3: Trip Generation Relative to AM Peak Traffic Volumes in CBD Direction

DCO	Frontage Road AM Site Peak Hour in CBD direction (veh)	AM Trip Generation (veh)	% AM Trip Generation of Frontage Road Traffic
1	207	112	54.11%
2	68	88	129.41%
3	3410	126	3.70%
4	2743	116	4.23%
5	404	32	7.92%
6	1369	108	7.89%
7	1410	112	7.94%
8	897	56	6.24%
9	142	70	49.30%
10	1217	234	19.23%
<i>Average</i>	<i>1187</i>	<i>105</i>	<i>29.00%</i>

The relationship between each Drive-Thru Coffee Outlet (DCO) trip generation and the CBD bound AM Peak traffic volumes on the frontage road is displayed in Figure 5.2 below.

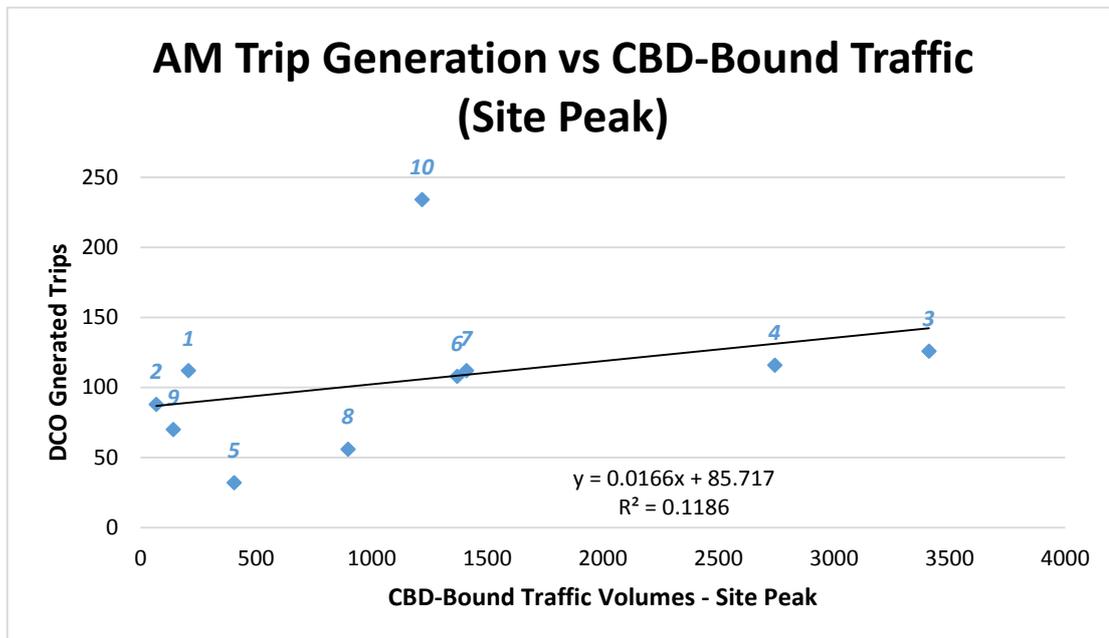

Figure 5.2: Correlation between AM trip generation and Frontage Road Peak Hour Traffic Volumes (Site Peak)

While an increase in AM peak frontage traffic does show a minor trend of increasing DCO trips the trend is not consistent across all outlets. DCO 5, 8 and 10 show that generated trips are not reliant on the total frontage traffic. The calculated R^2 result indicates a 12% association with the independent variable, and as such it is considered that the provided survey results do not have enough consistency to show an accurate

and consistent relationship. As such no clear correlation or relationship can be formed during the AM peak period.

5.3.3 AM Peak Frontage Road Traffic in CBD Direction and Queue Lengths

Table 5.4 and Figure 5.3 show the data and analysis to test for any influence of the frontage road traffic volumes on DCO queue lengths. "Frontage Road AM Site Peak Hour in CBD Direction" refers to all traffic travelling towards the CBD on the road fronting each Drive-Thru Coffee Outlet (DCO) during the AM site peak hour. "AM Queue Length" refers to the maximum total vehicles queued at each DCO during the AM.

Table 5.4: Queue Length relative to AM Peak Traffic Volumes in CBD Direction

DCO	Frontage Road AM Site Peak Hour in CBD direction (veh)	AM Queue Length (m)	% AM Trip Generation of Frontage Road Traffic
1	207	6	2.90%
2	68	6	8.82%
3	3410	7	0.21%
4	2743	11	0.40%
5	404	2	0.50%
6	1369	6	0.44%
7	1410	7	0.50%
8	897	5	0.56%
9	142	6	4.23%
10	1217	11	0.90%
<i>Average</i>	<i>1187</i>	<i>6.7</i>	<i>1.94%</i>

The relationship between each Drive-Thru Coffee Outlet (DCO) queue lengths and the CBD bound AM Peak traffic volumes on the frontage road is displayed in Figure 5.3 below.

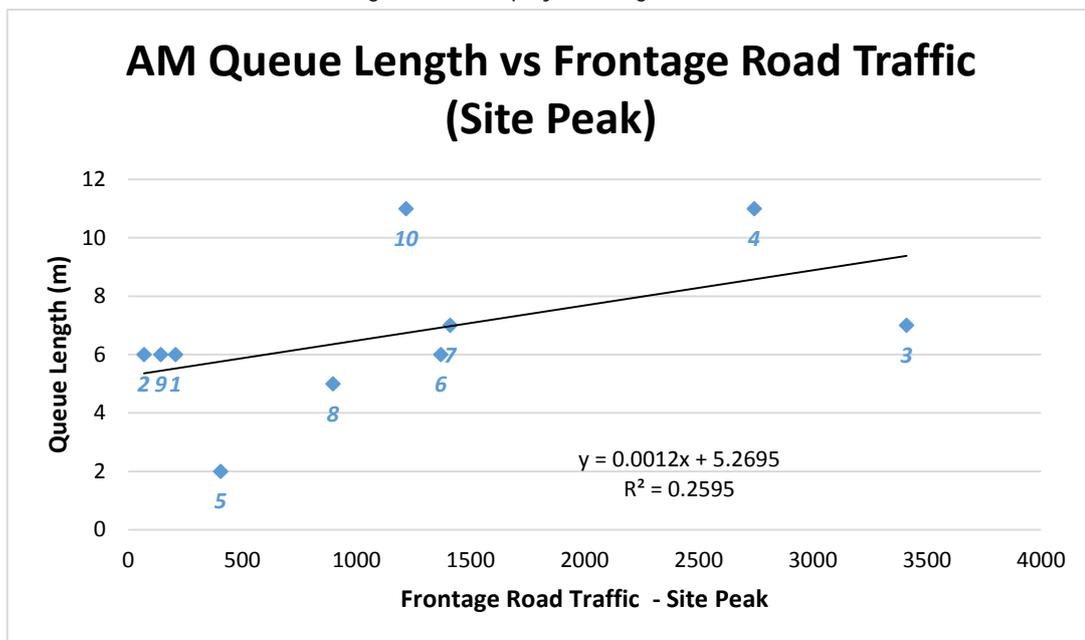

Figure 5.3: Correlation between AM trip generation and Frontage Road Peak Hour Traffic Volumes

Whilst there seems to be some correlation, the results should be viewed with caution as there are other influencing factors such as accessibility of traffic from both directions of the road, service times and the

number of vehicles served. The calculated R² of 26% association with the independent variable is not sufficiently significant to accept a direct relationship.

5.3.4 Outlet Trip Generation and Two-Way Traffic Volumes

Table 5.5 and Figure 5.4 show the data and analysis to test for any influence of the total two-way frontage road traffic volumes during the AM network peak on trip generation. "Frontage Road AM Network Peak Hour Two Way" refers to all traffic travelling in either direction along the road fronting each Drive-Thru Coffee Outlet (DCO). "AM Trip Generation" refers to total vehicle trips (twice vehicles served) utilising each DCO in the AM peak (1 hour).

Table 5.5: Trip Generation Relative to Total Two-Way Traffic Volumes in AM Site Peak

DCO	Frontage Road AM Network Peak Hour Two Way (veh)	AM Site Peak Hour Trip Generation (veh)	% AM Trip Generation of Frontage Road Traffic
1	413	112	27.12%
2	124	88	70.97%
3	5684	126	2.22%
4	4572	116	2.54%
5	746	32	4.29%
6	2002	108	5.39%
7	2098	112	5.34%
8	1899	56	2.95%
9	232	70	30.17%
10	2213	234	10.57%
<i>Average</i>	<i>1998</i>	<i>105</i>	<i>16.16%</i>

Table 5.5 shows large differences in each DCO's trip generated percentage of total traffic indicating no clear relationship between the two. The relationship between each Drive-Thru Coffee Outlet (DCO) trip generation and total two-way AM Network Peak traffic volumes is displayed in Figure 5.4 below

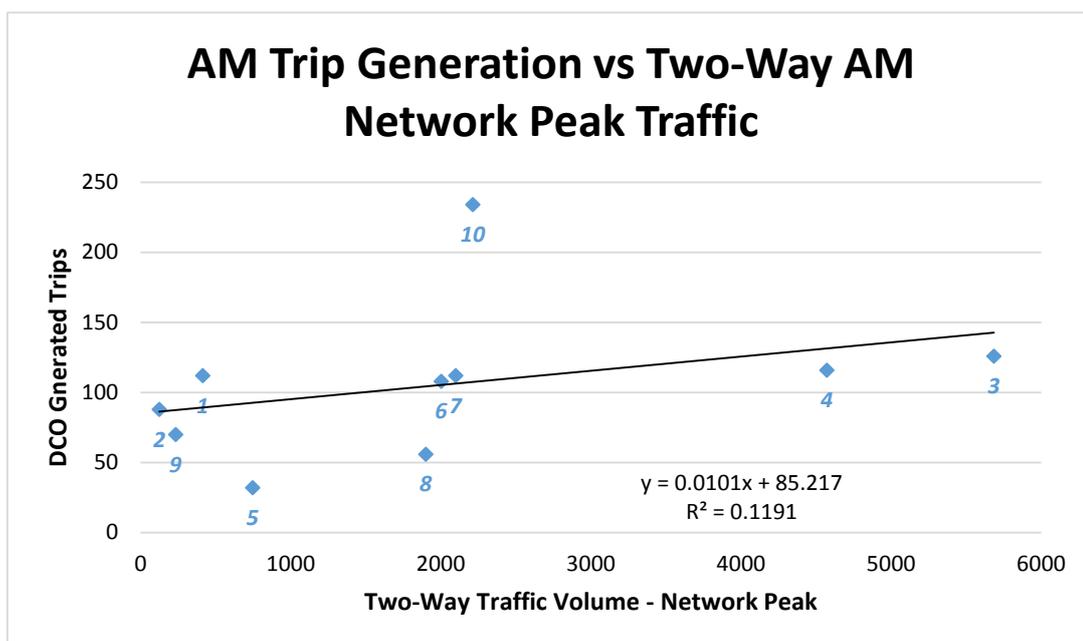

Figure 5.4: Correlation between AM Peak Two-way Volumes and Outlet Trip Generation

The results of this analysis, from both directions, considering traffic does not show any significant difference compared to the test against one-way traffic (refer Figure 5.4). The calculated R² result indicates a 12% association with the independent variable, as such it is considered that no clear correlation or relationship can be formed.

5.3.5 Trip Generation in relation to DCO GFA

Table 5.6 and Figure 5.5 show the data and analysis to test for any influence of the Gross Floor Area (GFA) on trip generation in the AM peak period. "GFA" refers to the total Gross Floor Area of each Drive-Thru Coffee Outlet (DCO). It is noted that some DCO GFA's have been estimated based on aerial imaging due to no available plans or data. "Generated site AM Peak Trips" refers to total vehicle trips (twice vehicles served) utilising each DCO.

Table 5.6: GFA Impact on Trip Generation

DCO	GFA	Generated Site AM Peak Trips	Trip Rate Based on GFA
1	24	112	4.67
2	24	88	3.67
3	200	126	0.63
4	7	116	16.57
5	150	32	0.21
6	140	108	0.77
7	117	112	0.96
8	54	56	1.04
9	80	70	0.88
10	60	234	3.90
<i>Average</i>	<i>86</i>	<i>105</i>	<i>3.33</i>

Table 5.6 shows large differences in each DCO's trip rate based on total GFA indicating no clear relationship between the two. The relationship between each Drive-Thru Coffee Outlet (DCO) GFA and Generated AM Peak traffic volumes is displayed in Figure 5.5 below.

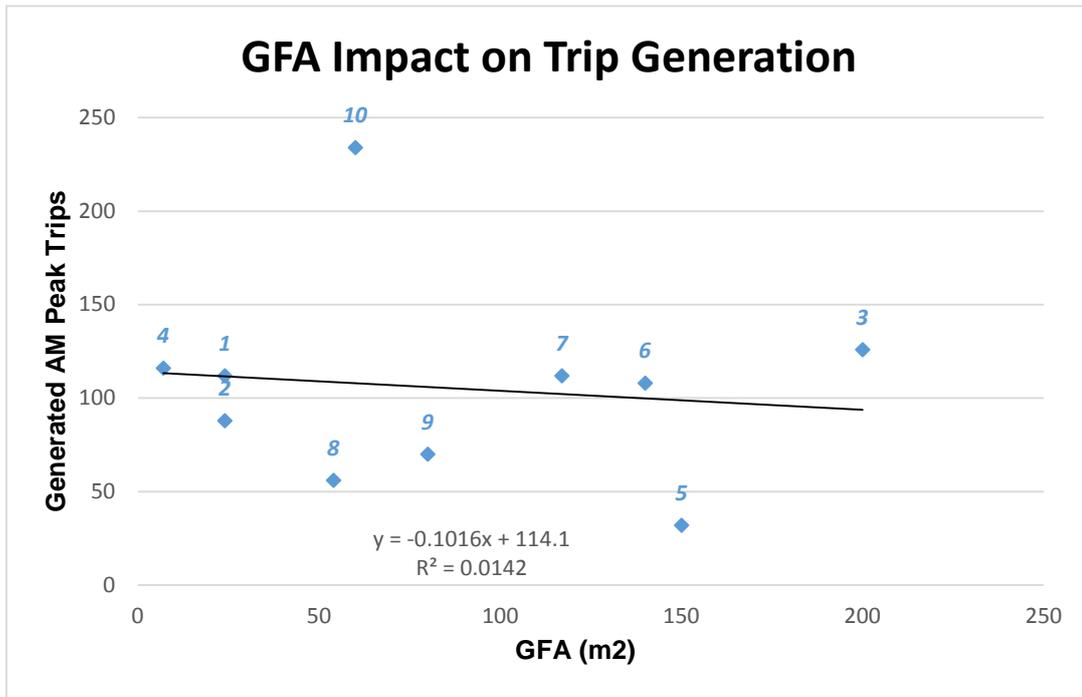

Figure 5.5: Trip Generation Measured Against GFA

No clear correlation can be seen between the generated trips and GFA of the DCO's.

5.3.6 Trip generation in relation to DCO Queue Lengths

Table 5.7 and Figure 5.6 show the data and analysis to test for any influence of each DCO's generated trips in the AM peak on maximum queue lengths. Below summarises the appropriate survey data, with full data sets are available in the Appendices. "Generated AM Site Peak Trips" refers to DCO generated vehicle trips during the AM peak period. "Queue Length" maximum queue lengths for each DCO in the AM peak (1 hour).

Table 5.7: Maximum Queue Length Relationship to Trip Generation

DCO	Generated AM Site Peak Trips	Queue Length	% Queue Length of Trip Generation
1	112	6	5.36%
2	88	6	6.82%
3	126	7	5.56%
4	116	11	9.48%
5	32	2	6.25%
6	108	6	5.56%
7	112	7	6.25%
8	56	5	8.93%
9	70	6	8.57%
10	234	11	4.70%
<i>Average</i>	<i>105</i>	<i>6.7</i>	<i>6.75%</i>

Table 5.7 shows a similar relationship between queue length and trip generation for the majority of DCO's. The relationship between each Drive-Thru Coffee Outlet (DCO) queue length and trip generation is graphed in Figure 5.6 below.

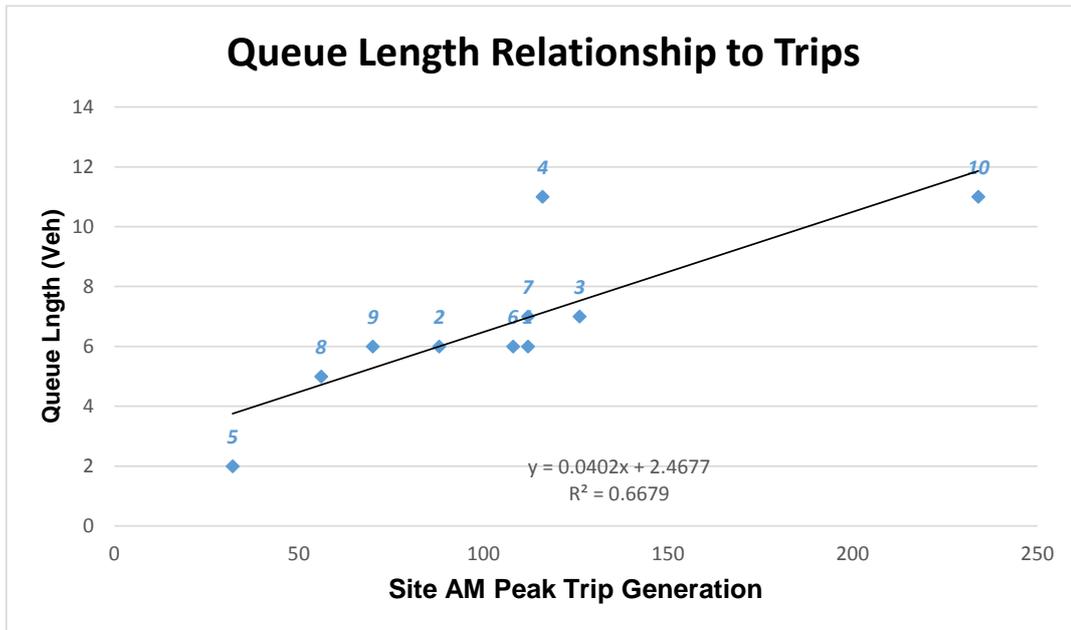

Figure 5.6: DCO Queue Lengths in relation to Generated Trips

The results of this analysis shows a relationship between queue lengths and trip generation, however there are other contributing factors that impact on the trip generation, including service times. The calculated R² result indicates a 67% association with the dependent variable and whilst indicating a clear relationship, it is not considered sufficiently significant to establish an associated specific rate.

5.3.7 Staff Number impact on Service Times

Table 5.8 and Figure 5.7 show the data and analysis to test for any influence of the DCO's number of staff on service times. The "Number of Staff" for each DCO and the corresponding "Service Time" is shown in Table 5.8. "Service Time" refers to how long on average it takes to service each customer, measured by the difference in time from entry to exiting the site.

Table 5.8: Staff Number and Service Timing

DCO	Number of Staff	Service Time (min)
1	3	4.22
2	3	4.38
3	3	4.26
4	2	3.48
5	2	2.68
6	3	3.46
7	3.5	3.93
8	2	2.73
9	4	5.48
10	4	4.08
<i>Average</i>	<i>2.95</i>	<i>3.87</i>

The relationship between each Drive-Thru Coffee Outlet (DCO) number of staff and average service times is displayed in Figure 5.7 below.

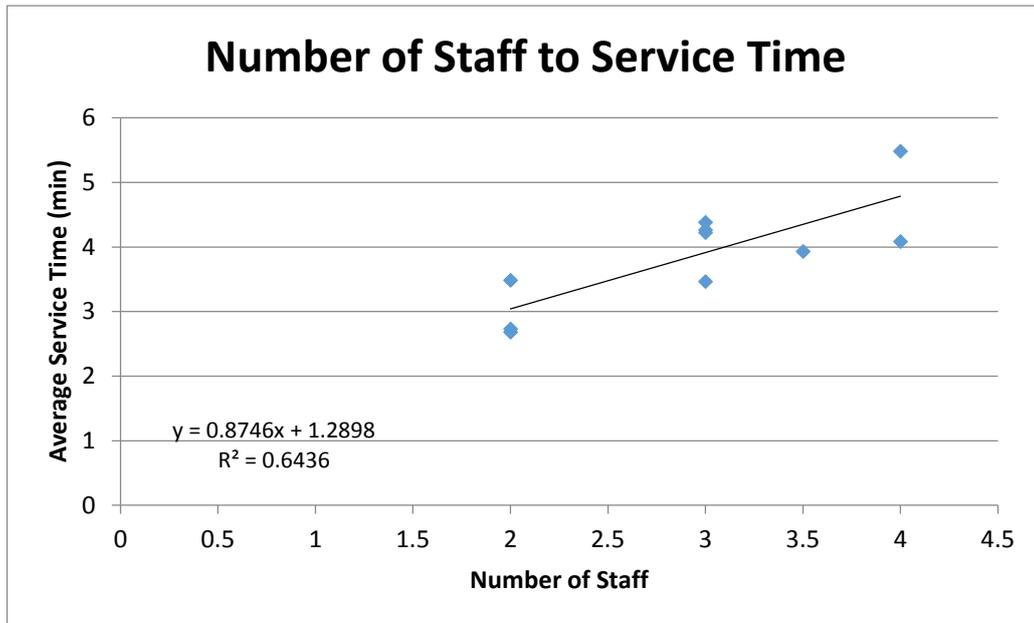

Figure 5.7: Staff Number Impact on Service Times

There appears to be a correlation between Number of Staff and Service Time, however this should be viewed cautiously as this analysis suggests that a higher number of staff results in an increased service time. Intuitively this does not seem logical. Therefore a reasonable conclusion is that outlets employ more staff to handle the quantum of customers, and service times naturally increase as business increases, hence the calculated R² of 64% indicating that correlation between the two variables is most likely the nature of the relationship rather than dependence.

5.3.8 Staff Number impact on Trip Generation

Table 5.9 and Figure 5.8 show the data and analysis to test for any influence of the DCO's number of staff on trip generation. The "Number of Staff" for and "Trip Generation" each DCO is tabulated for the AM peak period.

Table 5.9: DCO Staff Numbers and Trip Generation

DCO	Number of Staff	AM Site Peak Trip Generation (veh)
1	3	112
2	3	88

Table 5.9 shows large differences and inconsistencies in each DCO's trips generated and number of staff available indicating no clear relationship between the two. For example DCO 9 and DCO 10 both have four (4) staff but a large difference in trip generation, and DCO 4 and DCO 5 have large differences in trip

generation. The relationship between each Drive-Thru Coffee Outlet (DCO) trip generation and total number of staff is displayed in Figure 5.8 below.

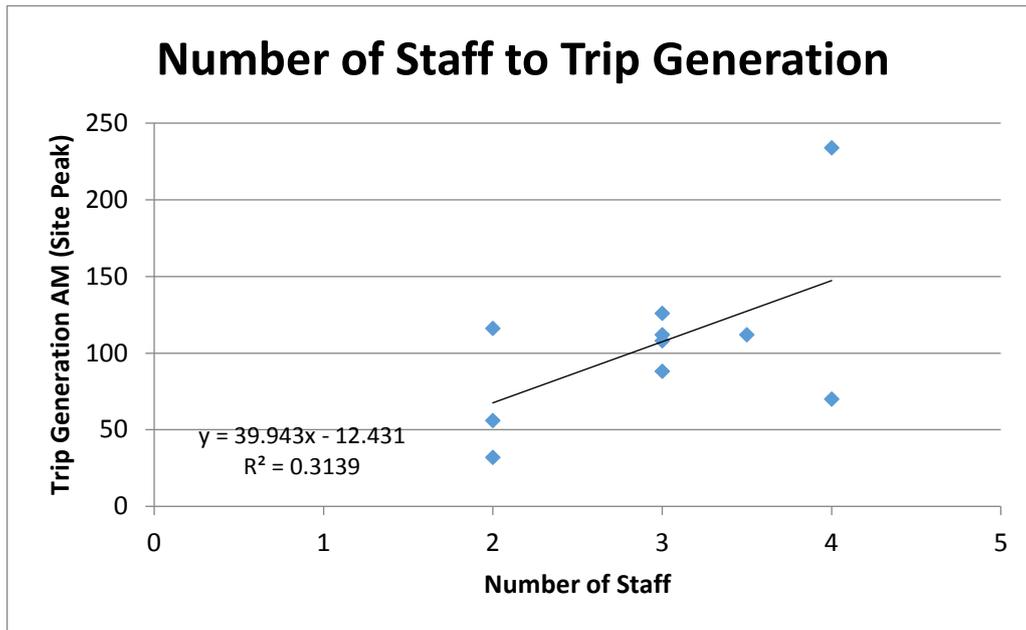

Figure 5.8: DCO Staff Numbers vs AM Peak Trip Generation

The graph and R² results indicate that there is some relationship between these two variables, however, similarly with the test result comparing queue lengths with trip generation, these results probably indicate correlation rather than dependency.

5.3.9 Queue Lengths compared to Service Times

Table 5.10 and Figure 5.9 show the data and analysis to test for any influence of DCO service times on queue lengths. "Service Time" refers to the average length of time it takes to serve a customer measured by the difference in time from entry to exiting the site, calculated across the AM peak period. "Queue Length" refers to the maximum amount of queued vehicles at each DCO in the AM peak (1 hour).

Table 5.10: Service Times and Queue Lengths

DCO	Service Time	Queue Length
1	4.22	6
2	4.38	6
3	4.26	7
4	3.48	11
5	2.68	2
6	3.46	6
7	3.93	7
8	2.73	5
9	5.48	6
10	4.08	11
<i>Average</i>	<i>3.87</i>	<i>6.7</i>

The relationship between each Drive-Thru Coffee Outlet (DCO) service time and maximum queue lengths is displayed in Figure 5.9 below.

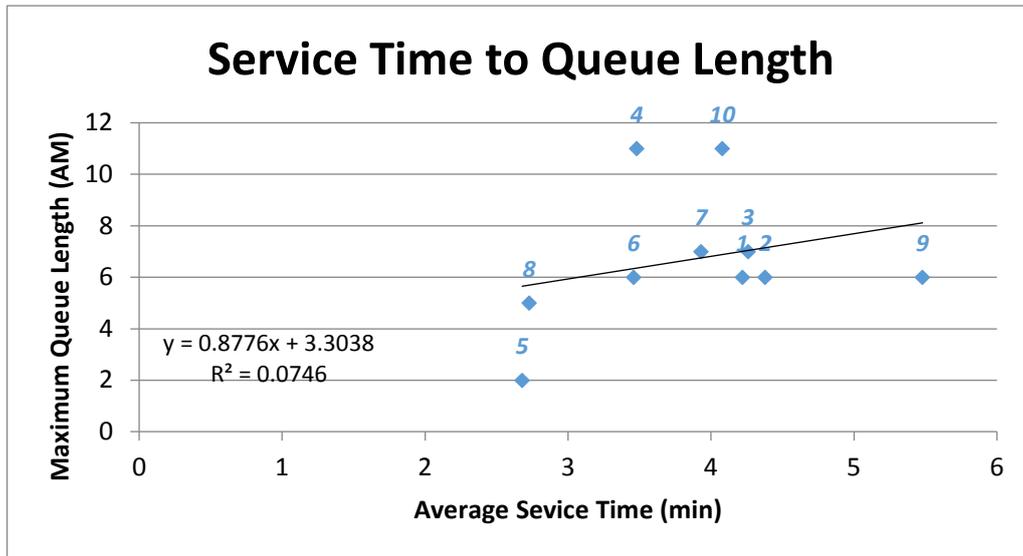

Figure 5.9: Service Times relationship with Queue Lengths

As shown above no clear relationship can be seen between the length of service time and maximum queue lengths.

5.3.10 Trip Generation in comparison with Average Service Times

Table 5.11 and Figure 5.10 show the data and analysis to test for any influence of DCO service times on trip generation. "Service Time" refers to the average length of time it takes to serve a customer, calculated across the AM peak period. "Trip Generation" refers to the total vehicle trips (twice vehicles served) generated by each DCO during the AM peak period.

Table 5.11: DCO Service Times and Trip Generation

DCO	Average Service Time	Site AM Peak Trip Generation
1	4.22	112
2	4.38	88
3	4.26	126
4	3.48	116

6	3.46	108
7	3.93	112
8	2.73	56
9	5.48	70
10	4.08	234
<i>Average</i>	<i>3.87</i>	<i>105</i>

The relationship between each Drive-Thru Coffee Outlet (DCO) average service time and trip generation is displayed in Figure 5.10 below.

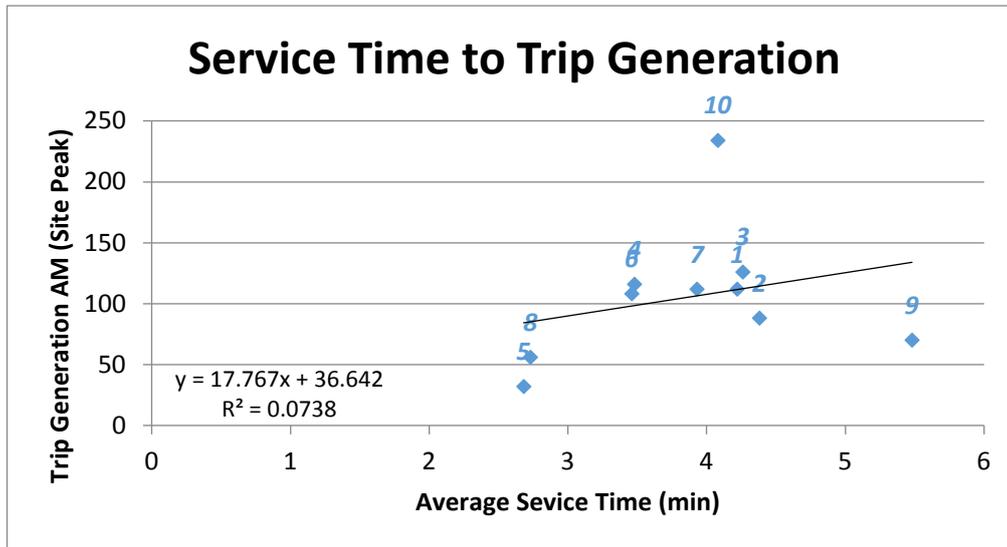

Figure 5.10: Service Times relationship with Trip Generation

As shown above no clear relationship can be seen between the length of service time and site trip generation.

5.3.11 Service Booth Numbers impact on Service Times

Table 5.12 and Figure 5.11 show the data and analysis to test for any influence of the number of Service Booths/Points/Staff on DCO service times. "Number of Service Booths" refers to number of service points/staff available at each DCO. "Service Time" refers to the average length of time it takes to serve a customer, calculated across the AM peak period and measured by the difference in time from entry to exiting the site.

Table 5.12: Service Booth Amounts and Average Service Times

DCO	Number of Service Booths/Points/Service Staff	Average Service Time
1	4	4.22
2	3	4.38
3	3	4.26
4	3	3.48

7	2	3.93
8	2	2.73
9	3	5.48
10	6	4.08
<i>Average</i>	3.2	3.87

The relationship between each Drive-Thru Coffee Outlet (DCO) service booth numbers and average service time is displayed in Figure 5.11 below.

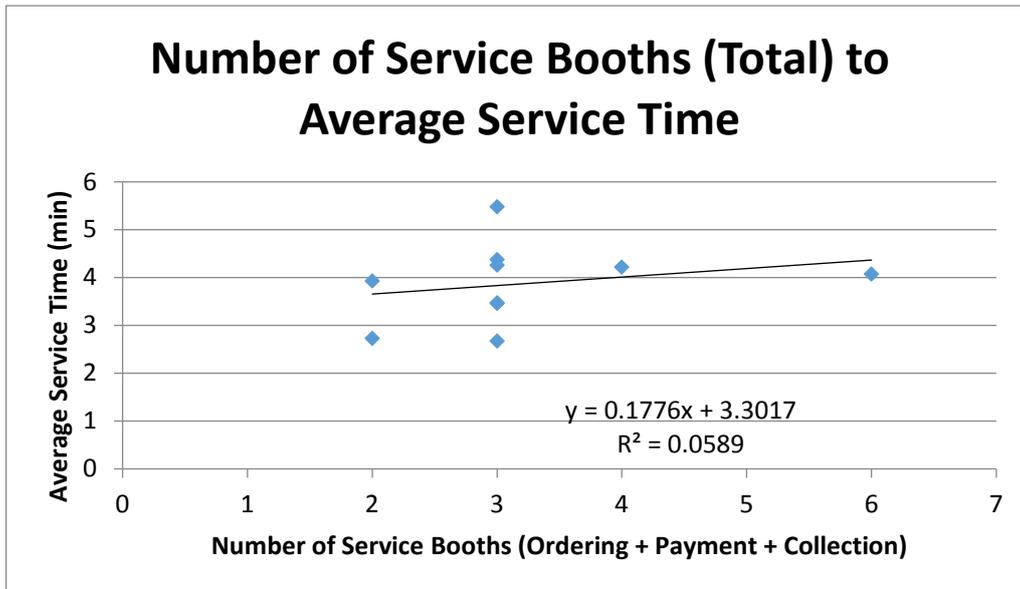

Figure 5.11: Service Booth Amount relationship with Service Times

As shown above no clear relationship can be seen between the number of service booths/points/service staff and length of service time at DCO's.

5.3.12 Service Booth Numbers impact on Trip Generation

Table 5.13 and Figure 5.12 show the data and analysis to test for any influence of the number of Service Booths/Points/Staff on trip generation. "Number of Service Booths" refers to number of service points available at each DCO. "Trip Generation" refers to total vehicle trips that visit each DCO during the AM peak period.

Table 5.13: Service Booth Amount and Trip Generation

DCO	Number of Service Booths/Points/Service Staff	Site AM Peak Trip Generation
1	4	112
2	3	88
3	3	126
4	3	116
5	3	32
6	3	108
7	2	112
8	2	56
9	3	70
10	6	234
<i>Average</i>	<i>3.2</i>	<i>105</i>

The relationship between each Drive-Thru Coffee Outlet (DCO) average service time and trip generation is displayed in Figure 5.12 below.

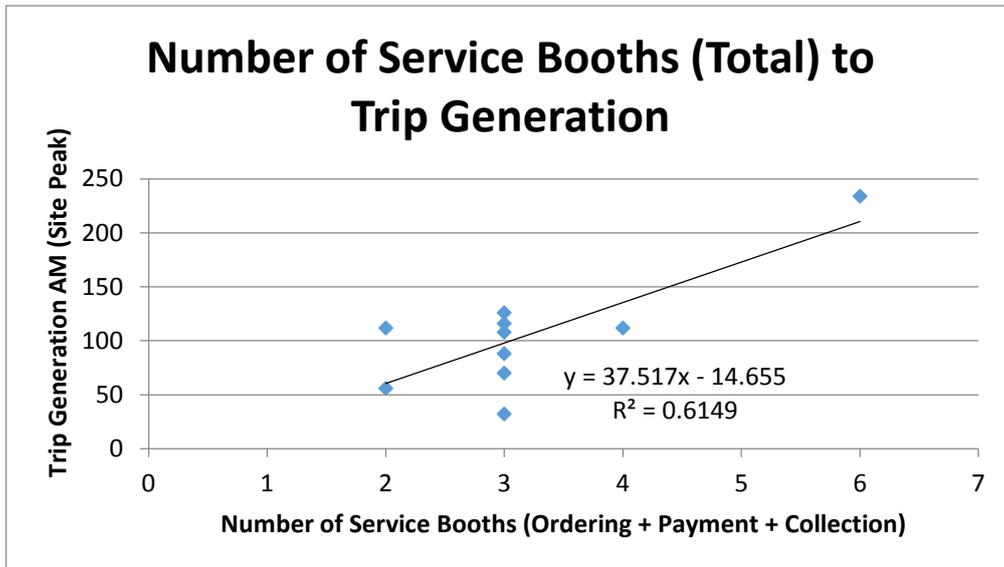

Figure 5.12: Service Booth Amount impact on Trip Generation

Whilst the R^2 calculation of 61% association with the dependent variable is not sufficiently high enough to assert a distinct relationship, it can be reasonably concluded that a higher number of service points are operated by outlets to cater for the businesses generated trips. Therefore, the relationship is probably more correlation than dependency, or the number of service points are driven by the business requirements (trip generation).

5.4 DCO LOCATION RELATIONSHIPS

Survey data was analysed, to determine possible relationships based on the location of each Drive-Thru Coffee Outlet (DCO). DCO locations have been defined as *CBD inbound* and *CBD outbound*. Where *CBD inbound* refers to outlets located to service a majority catchment of vehicles heading towards the nearest CBD and *CBD outbound* refers to outlets located to service a majority catchment of vehicles leaving the nearest CBD. All data is during the AM peak period.

5.4.1 AM Period Roadside traffic in relation to Passing Trade by DCO location

Table 5.14 and Figure 5.13 show the data and analysis to test for any influence of the DCO location on the percentage of vehicles utilising the outlet. “% of Passing Trade” refers to the percentage of all traffic utilising each Drive-Thru Coffee Outlet (DCO) on their way to an alternate destination.

Table 5.14: CBD Inbound AM Period Traffic Volumes and DCO Passing Trade

Outlet	Positioned to cater for CBD <i>inbound</i> traffic (AM Peak) ¹ % of Passing Trade ²	Positioned to cater for CBD <i>outbound</i> traffic (AM Peak) ¹ % of Passing Trade ²	Comments
DCO 1	-	-	-
DCO 2	80	80	Easily Accessible for both inbound and outbound traffic. Located on a quiet side street but accessing an enclosed industrial catchment area. No specific distinction can be made regarding catchment of CBD bound AM Peak traffic.
DCO 3	95	-	Accessible by both inbound and outbound CBD traffic due to traffic lights location. More inbound orientated than outbound.
DCO 4	91	-	Accessible by both inbound and outbound CBD traffic. More inbound orientated than outbound.
DCO 5	-	-	-
DCO 6	60	-	Captures only AM peak inbound traffic
DCO 7	-	83	Captures mainly AM peak outbound traffic
DCO 8	-	83	Captures only AM peak outbound traffic (Gold Coast Assumed as CBD)
DCO 9	-	-	-
DCO 10	-	88	Captures mainly AM peak outbound traffic from Melbourne CBD

1. Note that outlets 1, 5 and 9 have not provided survey data and have been omitted from this comparison

2. Passing trade are drop-by vehicles with an alternative final destination

Table 5.14 shows no distinct differences in each DCO's passing trips based on location indicating no clear relationship based on *inbound* or *outbound* catchments. The relationship between the location of each Drive-Thru Coffee Outlet (DCO) and percentage of passing trade is displayed in Figure 5.13 below.

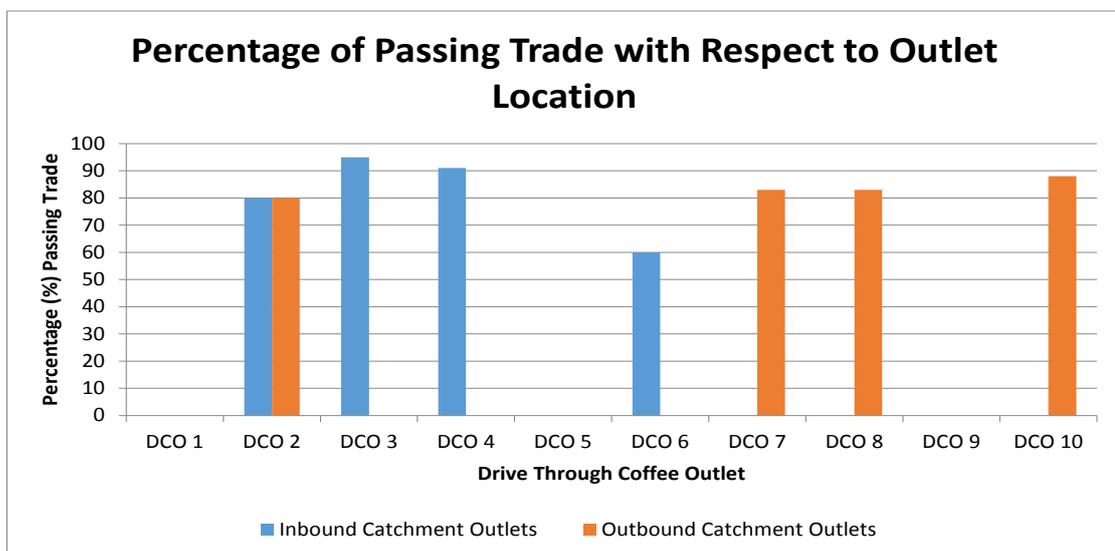

Figure 5.13: DCO Location Relationship between CBD Inbound Traffic and Passing Trade

As shown above no clear relationship can be seen based on the location of each DCO in the AM peak period.

5.4.2 AM Period Roadside traffic in relation to Trip Generation by DCO location

Table 5.15 and Figure 5.14 show the data and analysis to test for any influence of the DCO location and corresponding frontage traffic volumes on trip generation. "Trip Generation" refers to all traffic generated by each Drive-Thru Coffee Outlet (DCO) during the AM peak period.

Table 5.15: CBD Inbound Site AM Period Traffic Volumes and DCO Trip Generation

Outlet	Positioned to cater for CBD <i>inbound</i> traffic (AM Peak) Trip Generation	Positioned to cater for CBD <i>outbound</i> traffic (AM Peak) Trip Generation	Comments
DCO 1	112	112	Easily Accessible for both inbound and outbound traffic in both directions and is located within CBD. No specific distinction can be made regarding inbound/outbound.
DCO 2	88	88	Easily Accessible for both inbound and outbound traffic. Located on a quiet side street but accessing an enclosed industrial catchment area. No specific distinction can be made.
DCO 3	126	-	Accessible by both inbound and outbound CBD traffic due to traffic lights location. More inbound orientated than outbound.
DCO 4	116	-	Accessible by both inbound and outbound CBD traffic. More inbound orientated than outbound.
DCO 5	32	-	Captures mainly AM peak inbound traffic into Bathurst on Mwy
DCO 6	108	-	Captures only AM peak inbound traffic
DCO 7	-	112	Captures mainly AM peak outbound traffic
DCO 8	-	56	Captures only AM peak outbound traffic (Gold Coast Assumed as CBD)
DCO 9	-	70	Captures mainly AM peak outbound traffic from/through Bathurst on Greater Western Highway
DCO 10	-	234	Captures mainly AM peak outbound traffic from Melbourne CBD

Table 5.15 shows no distinct differences in each DCO's trip generation based on location indicating no clear relationship based on *inbound* or *outbound* catchments. The relationship between the location of each Drive-Thru Coffee Outlet (DCO) and percentage of passing trade is displayed in Figure 5.14 overleaf.

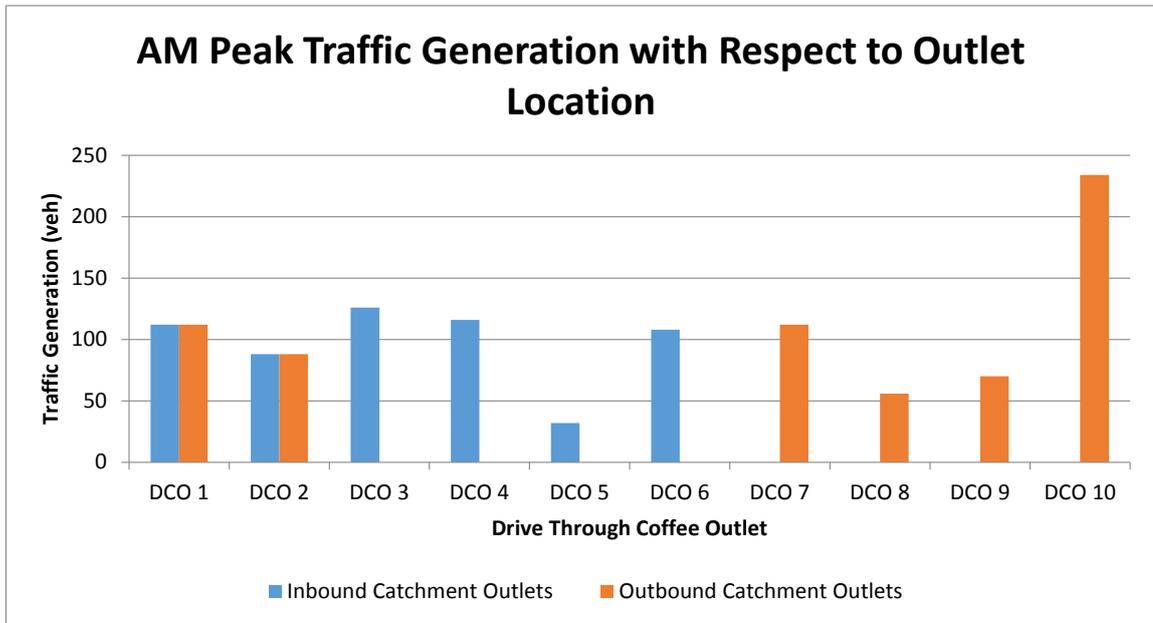

Figure 5.14: DCO Location Relationship between CBD Inbound Traffic and Trip Generation

As shown above no clear relationship can be seen based on the location of each DCO in the AM peak period.

6. CONCLUSIONS

The key factors impacting the local traffic operations at any one location appear to be:

- Significantly more customers use the drive through coffee outlets in the AM rather than the PM;
- the week-long surveys confirm that there are a very low number of customers on weekends with most drive through coffee outlets not open on weekends;
- there is a consistent high percentage of passing trade;
- the queuing capacity of the sites were sufficient to avoid queued vehicles from spilling out into the adjacent roadway, which could be an indicator of customers' limited tolerance to waiting times;
- the number of staff serving to reduce service times; and
- the relationship between road frontage traffic volumes and trip generation (including capturing AM peak traffic in the CBD inbound direction) is evident although statistically insignificant

Other influencing factors that are difficult to quantify include:

- visible exposure to passing traffic;
- ease of access to the site;
- ease of site egress;
- quality and visibility of signage;
- reputation;
- advertising; and
- quality of beverages, food and service.

These independent variables of influence could be rated subjectively to test against dependent variables but in most cases this would be impractical.

Of interest is the consistency of service times across all outlets. This may be due to the fact that the equipment of the outlets only has the capacity to produce a maximum rate of coffees, which in turn would govern the number of staff required to operate and serve customers (again a fairly consistent number across the outlets surveyed), which again would influence the service time. It may well be that customers are prepared to wait up to 5 minutes and if service times are longer they could change their morning purchasing regime, meaning that there is a "levelling out" of the number of trips that an outlet can accommodate based on the coffee making equipment they have.

Table 6.1 includes the R^2 results of the linear regression analyses, with the more significant relationships highlighted. Adopting the generally accepted principle that any R^2 values less than approximately 80% are indicative of poor dependent and independent variable relationships, it can be concluded that the analyses for all survey datasets analysed indicate that the level of association of dependent and independent variables is not sufficient to draw any accurate relationships or conclusions.

7. RECOMMENDATIONS

The highlighted inter-relationships identified in Table 6.1, whilst indicative of some dependence, can be explained by reasoning of normal operations of a business such as DCOs. The mere presence of the road side outlet together with the influencing factors described in Section 6 including signage and advertising creates the market for the outlets. The customer demand (generated trips) then requires an optimum number of service booths and staff to ensure that customers are served quickly to encourage repeat business. Ensuring fast service also manages the queue lengths and long queue lengths themselves are likely to discourage customers; hence a 'levelling out' of patronage.

The graph shown in Figure 7. 1, duplicated from Figure 5.1, shows that with the exception of a small number of outlets surveyed, due to local circumstances and excluded as "outliers", it appears that a range of trip generation rates could be reasonably adopted between 70 – 130 AM peak hour trips, with consideration given to other potentially influencing factors. The lower than average trip generation of DCO5 and DCO8 can possibly be explained by their location. DCO5 is a regional outlet with a low volume of passing traffic. DCO8 is a sub-metropolitan outlet on a frontage road that does not have a clear peak AM direction and is relatively low. Additionally DCO8 only captures traffic in one direction. DCO10 on the other hand has very high trip generation possibly due to a highly visible location to passing traffic, its unique operation of having two service lanes, has an open 'veranda' style of service with staff attending directly to vehicles in the queue and the outlet has been operating for a number of years and has built up a strong patronage.

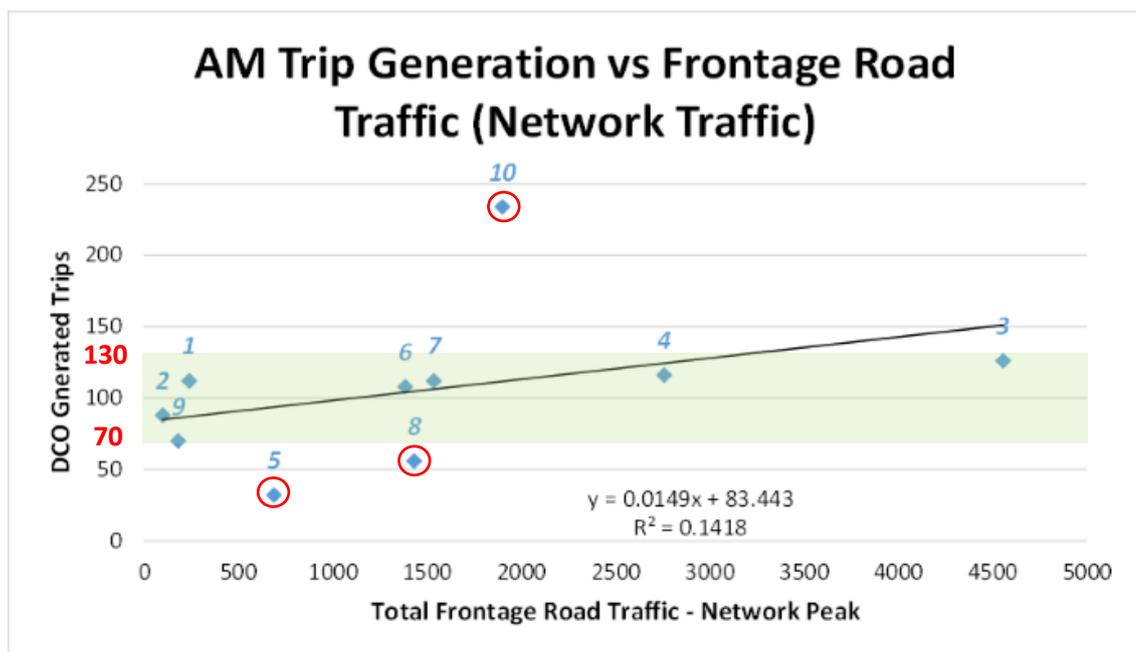

Figure 7. 1: Trip Generation Range

It is therefore recommended that a range of values between 70 and 130 trips in the AM peak hour be adopted as an estimate for trip generation of drive through coffee outlets. This is consistent with the average trip generation for the AM site peak calculated for all DCOs of 105. (Refer to Table 5.2).

Given the analyses demonstrate some relationships between outlet characteristics albeit not statistically significant, it is recommended that when assessing proposed DCO developments, selection of an appropriate traffic generation rate should consider the range of variable influencing factors itemised in Section 6.

The information gathered from customer interviews relating to 'pass-by' purchases is considered to be robust and consistent across all outlets surveyed. It is therefore recommended that the average passing trade percentage of 83% is adopted in calculations of the trip generation impacts on the surrounding road network when assessing traffic impacts of proposed drive through coffee outlets.
